

Water Resources Management Program at Los Alamos National Laboratory

Sustainable Use and Global Understanding

LAUR-01-5357

Why Worry about Water?

Global Freshwater Crisis

**World Population
Outstripping Available
Water Supply**

**Available freshwater in
lakes and streams only
0.00019%**

**2025 Freshwater Shortfall
equals 2,000 m²**

Water Shortage Impacts

**1.4 + billion people lack
access to safe water supply
(UN)**

**50% of people globally
lack adequate sanitation**

**20% of world's freshwater
fish species are endangered
because of water-related
causes**

**80% of disease in developing
countries caused by
contaminated water: 5-7
million people die annually,
one child every eight seconds**

U.S. Security Concerns

Transboundary water conflicts create security concerns for the United States

**Water security flashpoints:
Jordan River, Nile Basin,
Mekong Basin, East Asia and
South Africa**

**Water shortages threaten
regional stability in China,
India and Mexico**

Water & Economic Security

Foreign disaster relief:

- **Floods and drought cost billions in damage and loss of life**

Decreased agricultural production:

- **Water shortages**
- **Water Contamination**

Health related costs:water-born disease

Increasing energy costs

Major Scientific Challenges

**Impact of the
Global climate
on hydrologic
cycle**

**Interaction of
the carbon cycle
with the
hydrologic cycle**

**Local and regional
solutions to
contamination**

**Consequences of
energy utilization**

**Integration of
models across
multiple scales**

**Climate-change models with sufficient regional resolution to
predict water resource availability**

Why Los Alamos?

- National Security Mission Includes Environment
- Unique Complex Systems Integration and Problem Solving Abilities
 - High performance computing
 - Modeling and simulation systems
- Shared Scientific and Technical Contributions

*NM semi-arid region is both case study
and test bed for new science and
technology approaches*

Water Resources

- **Laboratory operations require monitoring of legacy contaminants**
- **Water use and conservation are important elements of operational activities since water availability can limit future program development**
- **43 square mile, instrumented test bed for hydrological measurement and research**

Hydrogeologic Work Plan

Why: State concerns over contamination flow and transport

Goal: Characterization of Pajarito Plateau

Science: Comprehensive data management

- 3-dimensional model of geologic structure
- Flow & transport modeling to test alternatives

Result: Information for management of contamination transport

LANL Watershed Planning and NPDES Storm Water Monitoring

**Goal: Collect critical information
on storm water runoff**

**Science: Automated stream-
monitoring stations in canyons:**

**Trigger collection of samples
from runoff events**

**Inform Lab that a sample is
collected**

**Provide discharge record for
tributaries and canyons**

**Result: Monitor
compliance with State &
Federal regulations**

Water Resources Regulatory Compliance Programs at LANL

Goal: Assist U. S. EPA and NMED to develop water standards

Science: LANL collections, data and models

Result: Appropriate Federal and State Standards (i.e., arsenic, uranium, etc.)

Water Quality Research

Goal: Reclaim usable water supplies with treatment technologies

Science: Develop new separation materials & hybrid membranes

Result: LANL has developed award-winning (R&D 100) water treatment technologies in groundwater, drinking water, process water, and drainage water that impact DOE contaminated sites, industry and health

P2/Waste Minimization Project: Western Area Sanitary Water Reuse

**Goal: Improve SWS
operation and decrease
Lab reliance on potable
water for cooling**

**Science: Increase organic
loading by diverting
200,000 GPD of influent
from LAC**

**Result: Project will save
223 AFY**

Water Conservation Project

Goal: Maximize efficiency of water used in cooling towers

Science: Eliminate silica

Result: Assure adequate water supply for future missions

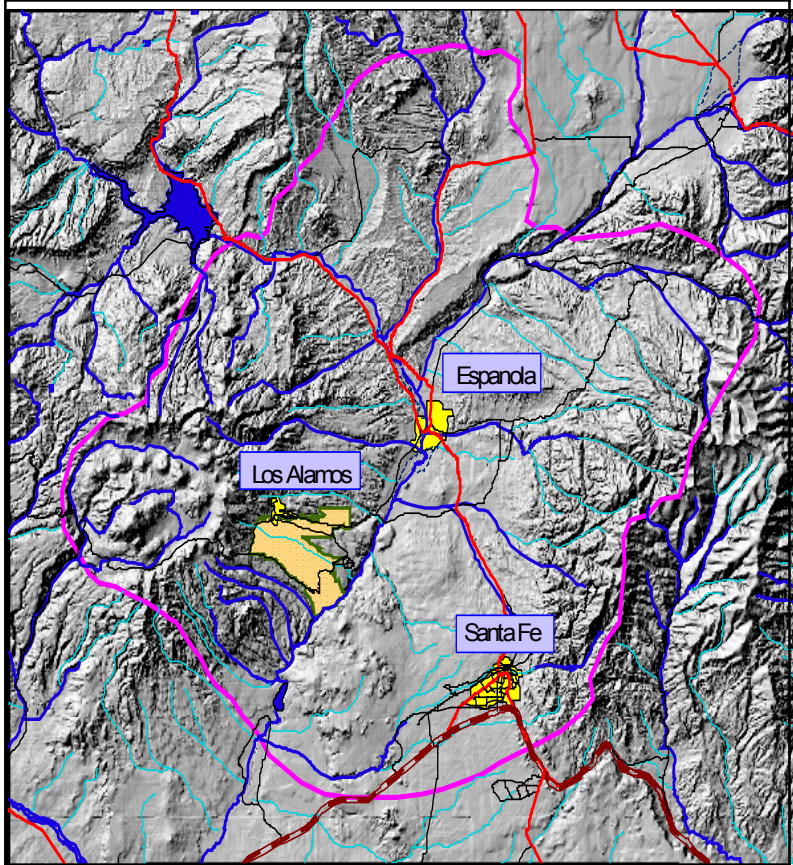

Regional Water Programs

Los Alamos is:

- A major user of regional water resources
- A partner in regional water agreements
- A neighbor in Northern New Mexico
- A source of technical support to local, state and regional planning activities

Espanola Basin Aquifer Model

Goal: Predict future changes in groundwater quality & quantity

Science: LANL is developing:

- **3-D geologic model**
- **Flow & transport models of regional aquifer and Pajarito Plateau**

Result: Predictive models to support groundwater protection and regional water planning

National Science Foundation Science and Technology Center

**Goal: Integration of field
observations & coupled
modeling**

**Science: Coupled numerical
modeling**

**Result: Understand Rio
Grande Basin hydrogeology
& coupled physical/chemical
water processes**

**Collaboration between: LANL,
SAHRA, NMIMT**

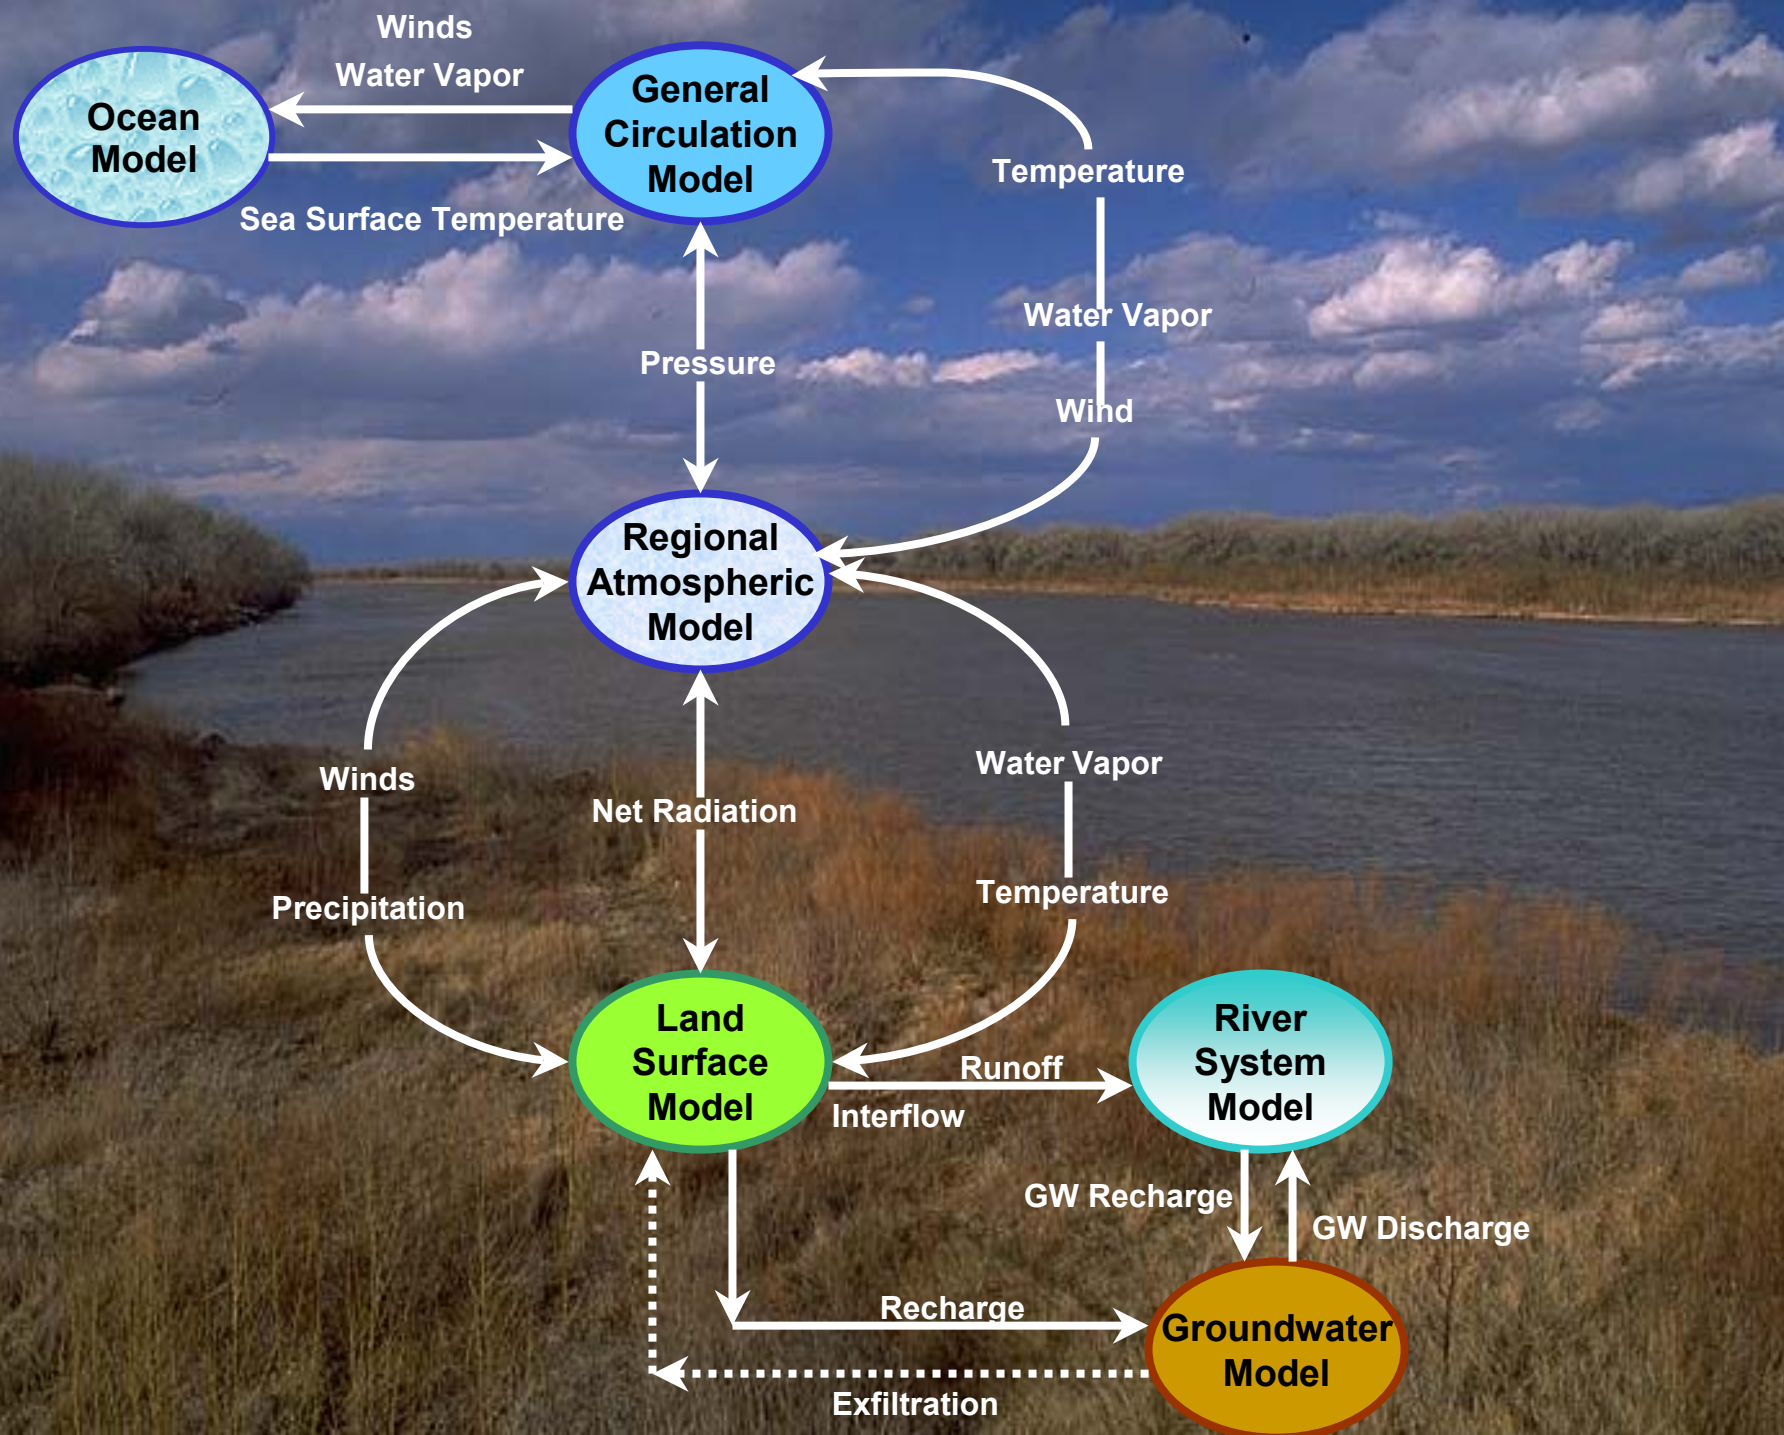

Rio Grande Integrated Water Cycle Model

Why: Regional Water Use is Vulnerable to Climate Change

Goal: Provide High Resolution Regional Water- Resource Predictions Within a Global Climate Context

Science: Integrate Surface Hydrology, Groundwater & Atmosphere in Rio Grande Water-Cycle Model

Result: More informed decision making & predictive capability

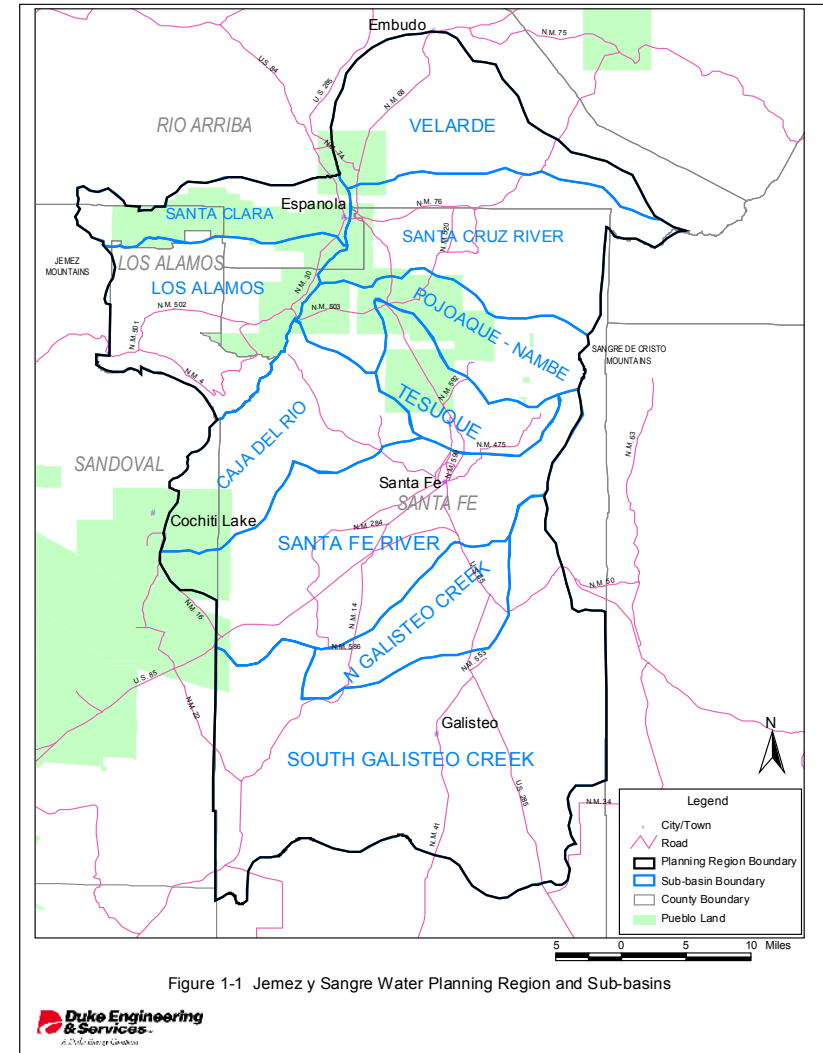

Jemez y Sangre Regional Water Plan

Goal: Interstate Stream Commission has mandated regional water planning to prevent out-of-state water transfers

Science: Supply/demand & populations projections

LANL has supplied an extensive database & significant staff resources

Result: 40-year plan for supply and demand equilibrium

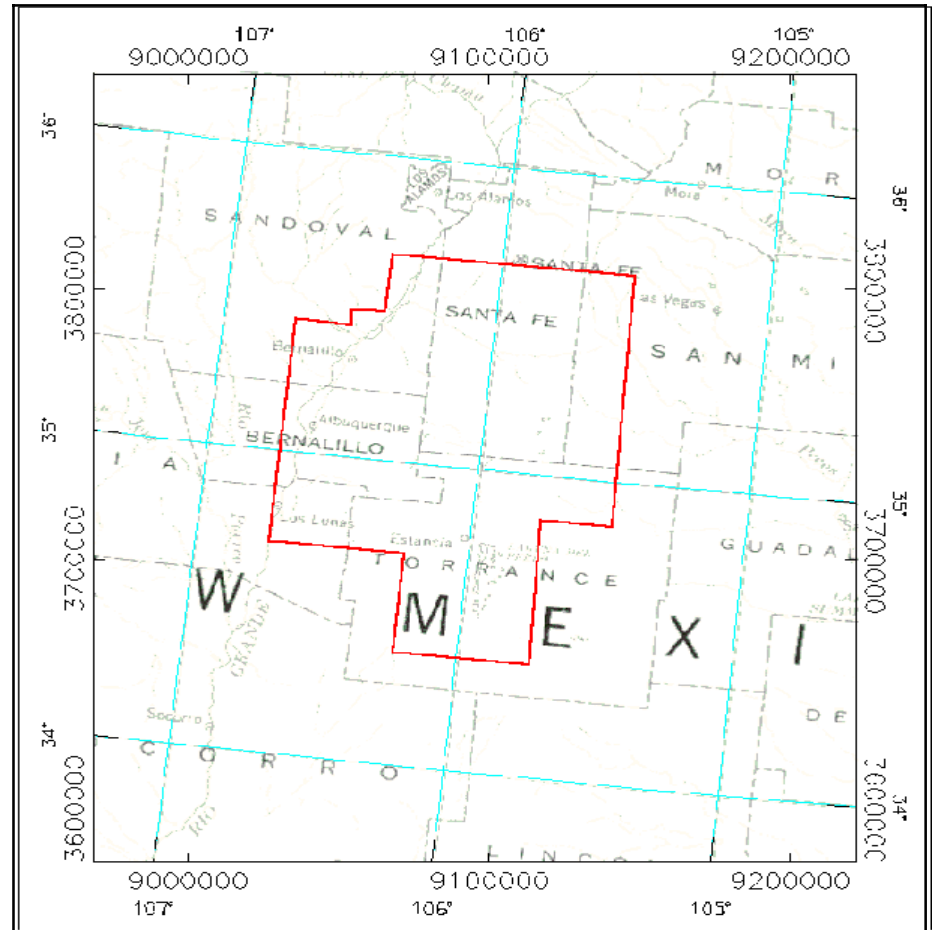

Estancia Basin Water Planning Commission

Goal: Predict aquifer depletion and salt water intrusion in the Estancia Basin

Science: LANL's process-modeling capability and Sandia's decision-analysis capabilities

Result: Framework for decision making on 40-year plan for ISC

Governor's Blue Ribbon Task Force on Water

**Goal: To recommend
changes to water
policy and water law**

**Science: Technical
support from LANL**

**Result: Remove
barriers to water
administration**

National Water Programs

- **Los Alamos is a major contributor of scientific and technical expertise on water resources measurement, modeling and simulation**
- **Work with DOE on fate and transport of contaminants in vadose zone and for repository citing verification**
- **Understanding of the hydrological cycle and the carbon cycle in global climate change and major target**
- **Key High Performance Computing capabilities**

DOE VADOSE ZONE ROADMAPPING

Goal: To understand the Vadose Zone & Accelerated Fluid Flow

Science: Physical and chemical process models; computational models; field experiments and instrumentation

Result: Information for resource management decisions

Collaboration between: DOE-Idaho, INEEL (lead), LANL, SNL, LLNL, SRL, Multiple Universities

Salton Sea Reclamation Studies

Goal: Restore Salton Sea for aquatic life and recreation

Science: Evaluation of

- Diked impoundment of lake**
- Pump-in pump-out**
- Desalination**

Top: Salton Sea, surrounded by agriculture. Left: Tilapia fish

Result: LANL testified on findings to US House of Representatives, Subcommittee on Water and Power

LANL's Role in DOE Atmospheric Radiation Measurement Program

**DOE ARM site on
the island of Manus
in the equatorial
Pacific**

**Goal: Refine global
circulation models**

**Science: Measure
cloud properties and
relate these
measurements to
climate processes**

**Result: Better
understanding of
Global Warming**

Office of Biological & Environmental Research for U.S. Global Climate Change Research Program

Draft Science Plan:

**LANL co-chairs committee to
develop scientific foundation**

**Goal: Predict seasonal to decadal
variability of the regional water
cycle**

**Science: Coupled modeling &
development of three regional test
beds**

**Result: Information for water
resource management**

Climate, Ocean, and Sea Ice Modeling (COSIM) project

**Goal: Develop and validate
ocean and sea ice models**

**Science: New techniques for
modeling ocean circulation, e.g.
El Nino/La Nina cycle
simulation**

**Result: Fully coupled climate
model**

International Activities

- **Los Alamos science, technology and organizational activities extend to global water resources issues**
- **Global crisis in freshwater availability requires innovative and integrated solutions**
- **Los Alamos expertise used by White House, State Department and other government agencies**
- **Water pollution prevention a major theme**

US-China Water Resources Management Program

**Goal: Long-term science
and technology programs
between China and US**

**Science: Water resource
efficiency in arid climate**

**Result: Scientific alliance
between China & US**

**LANL coordinates 11 US
government organizations to
accomplish this goal**

Committee on International Science, Engineering & Technology

**LANL leads White House Office
of Science & Technology Water
Working group**

**Goal: Anticipate S & T issues
related to global water crisis**

Result: Avoid global conflict

Science and Technology

- **Los Alamos science and technology working on underlying basis for water resources management decisions**
- **Global crisis in freshwater availability requires innovative and integrated solutions**
- **Conservation and Green Chemistry included**

Water Saving Technology

— 2001 R&D 100 Joint Entry —

SCORR—Supercritical CO₂ Resist Remover

Los Alamos National Laboratory, Agilent Technologies Inc., and GT Equipment/SC Fluids

ARROYO **SCFluids**

Benefits

- Provides a unique cleaning process compatible with the latest low-k materials and smaller (40-100 µm) dimensions necessary to advance the industry in the future.
- Removes photoresists, post-etch, etch, and CMP (chemical mechanical polishing) particulates residues from etched, reworked, and non-implanted semiconductor wafers.
- Costs much less than existing photoresist stripping solvent systems.
- Strips resists in roughly half the time required by current techniques by eliminating both rinse and dry steps.
- Reduces or eliminates the use of water as a final rinse step of the normal process.
- Reduces or eliminates the use of organic acids, organic photoresist strippers, and associated organic solvents presently used to dry wafers.

Applications

SCORR applies to any manufacturing process that requires photoresist removal. For example, SCORR:

- removes photoresists, resins, and particulates from ICs.
- removes photoresists from flat panel displays, thus increasing yieldability while decreasing panel size.
- increases information density in optical storage media (for example, CDs, DVDs, and CD-RW/DVs) and
- eliminates slaking (surface etching) in MEMS (micro-electromechanical systems).

BEFORE

AFTER

Los Alamos
NATIONAL LABORATORY

Goal: Eliminate water-based cleaning system in chip fabrication

Science: Supercritical Resist Removal uses CO₂ with propylene carbonate additive

Result: Water conservation & reduced operation costs

National Science Foundation Science & Technology Center Participants

**Diverse Capabilities Hold the Answers to
Global Water Problems**

Semiconductor Photoresist Removal

← Semiconductor component showing sidewall polymer prior to cleaning

Semiconductor component
After SCORR cleaning →

Plants with Improved Water Use Efficiency

Goal: Produce better plants with less water

Science: Identify and manipulate nutrient and carbon fixation mechanisms in plants

Result: Prototype plants successfully improve nitrogen use and water efficiency

Improved Water Conservation with Waste Materials

Goal: Increase plant productivity with reduced water

Science: Clay soils and coal mine spoil combinations are being tested for their ability to support plant growth in water limited growth regimes

Result: Combinations outperform productivity of plants in exclusively native soil or exclusively mine spoil

**Greenhouse studies are a collaboration between the
State of New Mexico and LANL.**

Understanding Uncertainty in Water Resource Predictions

- **Goal:** Predict a range of possibilities to different answers
- **Science:** Probabilistic models
- **Result:** Understand the probability of achieving an outcome

Effects of Plant Cover on Water Resources

Goal: To better understand how spatial variation in vegetation influences evapotranspiration

Science: Coupled modeling of hydrologic and chemical effects by automated field data collection

Result: Reduction in ET

**Collaboration with
Southwestern Universities**

Evapotranspiration Processes

Goal: To better understand the exchange of water vapor between the surface and the atmosphere

Science: Using LIDAR, rising and falling plumes and eddies of moisture can be seen and quantified.

Result: Identify water-saving improvements to ecosystem

Moisture levels over canopies show which trees consume the most water. LANL Raman Lidar Scan, San Pedro River Bosque

Reservoir Characterization

Goal: Petroleum exploration using seismic data

Science: Extended Local Rytov-Fourier Method, used by LANL scientists, lead to far superior images of the Earth's subsurface

Result: Applications for groundwater location and characterization.

Marmousi Model

Underground Test Area (UGTA)

Goal: To evaluate groundwater contamination from nuclear activity at Nevada Test Site

Science: Study radionuclide migration in groundwater

Result: Determine need for clean up of groundwater

Vision Statement

We serve the nation by applying the best science and technology to make the world a better and safer place

Mission: National Security

Accelerate focus on environmental solutions to make the world a healthier, safer and more prosperous place

LANL expertise in water chemistry, aqueous separations, hybrid membranes, coupled modeling and complex computing systems put us in a position to positively impact quality of life and world peace
